CLAIM SET AS AMENDED

1. (Currently Amended) A method for handling call requests, comprising:

providing a <u>private network including a plurality</u> of private branch exchanges, the private branch exchanges being connectable to and being compatible with a public switched <u>telephone</u> network, and being connectable to but not being compatible with a wireless communication network;

providing a plurality of controllers having computer integration technology on the private network;

coupling a controller having computer integration technology one of the controllers to each of the plurality of private branch exchanges and to the wireless communication network, each of said controllers being capable of instructing the corresponding private branch exchange to which it is coupled to execute a proper protocol via computer telephony integration;

receiving a request at one of the <u>private branch exchanges controllers</u> to complete a call originating from a wireless communication device to a central office;

executing a program in the controller corresponding said one of the private branch exchanges for determining whether or not a predetermined condition has been met, and if the

predetermined condition has been met, determining said proper protocol for processing said

request; and

instructing the said one private branch exchange receiving said call request to execute

said proper protocol,

thereby enabling completion of said call originating from the wireless communication

device to the central office.

2. (Original) The method as in claim 1, wherein said act of determining comprises

determining whether an appropriate signaling protocol is available for enabling completion

of said call.

3. (Currently Amended) The method as in claim 2, wherein said act of determining

whether an appropriate signaling protocol is available comprises determining whether a Q

signal sequence is available for enabling said private branch exchange to communicate with

at least one of a said public switched telephone network and an audio switch associated with

said wireless communications device.

4. (Currently Amended) The method as in claim 1, wherein said act of instructing

further comprises instructing said private branch exchange to communicate with a said public

switched telephone network.

Amendment dated: November 5, 2004

Reply to Office Action of June 7, 2004

Docket No. 3655-0146P Art Unit:2682

Page 4 of 24

5. (Original) The method as in claim 4 further comprising instructing said private

branch exchange to communicate with said wireless communications device.

6. (Original) The method as in claim 5, wherein said act of instructing comprises

instructing said private branch exchange to communicate with said wireless communications

device via an audio switch.

7. (Original) The method as in claim 6, wherein said act of instructing comprises

instructing said private branch exchange to communicate with said wireless communications

device via a two-way radio console and said audio switch.

8. (Original) The method as in claim 5 further comprising instructing said private

branch exchange to communicate status of said call to said wireless communications device.

9. (Original) The method as in claim 8, wherein said act of instructing comprises

instructing said private branch exchange to communicate a busy signal to said wireless

communications device when an intended receiving device of said call is not available to

accept said call.

Amendment dated: November 5, 2004

Reply to Office Action of June 7, 2004

Docket No. 3655-0146P Art Unit:2682

Page 5 of 24

10. (Original) The method as in claim 8, wherein said act of instructing comprises

instructing said private branch exchange to communicate a verbal message to said wireless

communications device.

11. (Original) The method as in claim 4, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to communicate with

said public switched telephone network by executing a predetermined set of instructions.

12. (Original) The method as in claim 11, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a

predetermined signaling protocol.

13. (Original) The method as in claim 12, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a Q signal

sequence.

14. (Original) The method as in claim 11, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a call vector.

15. (Currently Amended) A method for handling call requests, comprising:

Amendment dated: November 5, 2004

Reply to Office Action of June 7, 2004

Docket No. 3655-0146P

Art Unit:2682

Page 6 of 24

providing a private network including a plurality of private branch exchanges, the

private branch exchanges being connectable to and being compatible with a public switched

telephone network, and being connectable to but not being compatible with a wireless

communication network;

providing a plurality of controllers having computer integration technology on the

private network;

coupling one of a the plurality of controllers having computer integration technology

to each of the plurality of private branch exchanges and to the wireless communication

network, each of said controllers being capable of instructing the corresponding private

branch exchange to which it is coupled to execute a proper protocol via computer telephony

integration;

receiving a request at one of the private branch exchanges to complete a call

originating from a central office to a wireless communication device;

executing a program in the controller corresponding to said one of the private branch

exchanges for determining whether or not a predetermined condition has been met, and if the

predetermined condition has been met, determining said proper protocol for processing said

request; and

instructing the said one private branch exchange receiving said call request to execute

said proper protocol,

Amendment dated: November 5, 2004

thereby enabling completion of said call originating from the central office to the

wireless communication device.

16. (Currently Amended) The method as in claim 15, wherein said act of determining

comprises determining whether an appropriate signaling protocol is available for enabling

said private branch exchange to communicate with at least one of a-saidpublic switched

telephone network and an audio switch associated with said wireless communications device.

17. (Original) The method as in claim 16, wherein said act of determining whether an

appropriate signaling protocol is available comprises determining whether a Q signal

sequence is available for enabling completion of said call.

18. (Currently Amended) The method as in claim 15, wherein said act of instructing

further comprises instructing said private branch exchange to communicate with a-said

public switched telephone network.

19. (Original) The method as in claim 18 further comprising instructing said private

branch exchange to communicate with said wireless communications device.

Amendment dated: November 5, 2004

20. (Original) The method as in claim 19, wherein said act of instructing comprises

instructing said private branch exchange to communicate with said wireless communications

device via an audio switch.

21. (Original) The method as in claim 20, wherein said act of instructing comprises

instructing said private branch exchange to communicate with said wireless communications

device via a two-way radio console and said audio switch.

22. (Original) The method as in claim 19 further comprising instructing said private

branch exchange to communicate status of said call to said central office.

23. (Original) The method as in claim 22, wherein said act of instructing comprises

instructing said private branch exchange to communicate a busy signal to said central office

when said wireless communications device is not available to receive said call.

24. (Original) The method as in claim 22, wherein said act of instructing comprises

instructing said private branch exchange to communicate a verbal message to said central

office.

25. (Original) The method as in claim 18, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to communicate with

said public switched telephone network by executing a predetermined set of instructions.

26. (Original) The method as in claim 25, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a

predetermined signaling protocol.

27. (Original) The method as in claim 26, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a Q signal

sequence.

28. (Original) The method as in claim 25, wherein said act of instructing said private

branch exchange comprises instructing said private branch exchange to execute a call vector.

29. (Currently Amended) A system for handling call requests, comprising:

a private network having plurality of private branch exchanges being connectable to

and being compatible with a public switched telephone network, and being connectable to

but being not compatible with a wireless communication network, thus preventing the

private branch exchanges from communicating with the wireless communication network,

the private network also having a plurality of controllers having computer integrated

technology; and a plurality of controllershaving computer telephony integration technology

each of said controllers being coupled to one of the private branch exchanges and the

wireless communication network and for determining whether or not a predetermined

condition has been met, instructing each a corresponding one of the plurality of private

branch exchanges with regard to communicating between the wireless communication

network and the public switched telephone network, and

if the predetermined condition has been met, thereby enabling each one of the private

branch exchanges to communicate outgoing and incoming calls between the wireless

communications network and the public switched network.

(Original) The system as in claim 29 further comprising said wireless 30.

communication network.

31. (Original) The system as in claim 30, wherein said wireless communication

network comprises an audio switch coupled to said private branch exchange and also

coupled to said controller for enabling communication between said wireless

communication network and said public switched telephone network.

32. (Original) The system as in claim 31, wherein said wireless communication

network comprises a two-way radio console coupled to said audio switch and also coupled to

said controller for enabling communication between said wireless communication system

and said public switched telephone network.

33. (Original) The system as in claim 32, wherein said wireless communication

network comprises a plurality of wireless communication devices, each of said devices being

capable of communicating with said two-way radio console via a wireless link.

34. (Original) The system as in claim 33, wherein said plurality of wireless

communication devices comprise a plurality of wireless transceivers.

35. (Original) The system as in claim 29, wherein said controller is an adjunct

controller.

36. (Original) The system as in claim 29, wherein said private branch exchange is a

DEFINITY® private branch exchange.

37: (Original) The system as in claim 29, wherein said controller is configured to:

receive a request to complete a call in a direction from a wireless communication

device to a central office, or vice versa;

determine proper protocol for processing said request; and

instruct said private branch exchange to execute said proper protocol via said

computer telephony integration technology, thereby enabling completion of said call.

38. (Currently Amended) The system as in claim 29, wherein said controller is

configured to determine whether an appropriate signaling protocol is available for enabling

said private branch exchange to communicate with at least one of a-said public switched

telephone network and an audio switch associated with said wireless communications device.

39. (Original) The system as in claim 29, wherein said controller is configured to

determine whether a Q signal sequence is available for enabling completion of said call.

40. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate with a wireless communication device

of said wireless communication network.

41. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate status of said call to either said central

office or a wireless communication device of said wireless communication network.

42. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate a busy signal to either said central

office or a wireless communication device of said wireless communication network in

response to said call request when an intended receiving device of said call is not available to

receive said call.

43. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate a verbal status message to either said

central office or a wireless communication device of said wireless communication network in

response to said call request.

44. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate with said public switched telephone

network by executing a predetermined set of instructions.

45. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to communicate with said public switched telephone

network by executing a signaling protocol.

46. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to execute a Q signal sequence for communicating

with said public switched telephone network.

47. (Original) The system as in claim 29, wherein said controller is configured to

instruct said private branch exchange to execute a call vector for communicating with said

public switched telephone network.

48. (Currently Amended) A system for handling call requests, including

a private network having an adjunct controller coupled to a private branch exchange,

the adjunct controller also being coupled to and a wireless communication network.

the private branch exchange being connectable to and being compatible with a public

switched telephone network, and being connectable to but not compatible with the wireless

communication network,

the adjunct controller having computer telephony integration technology for

met, instructing the private branch exchange with regard to communicating between the

wireless communication network and the public switched telephone network, and

if the predetermined condition has been met, thereby enabling the private branch

exchange to communicate between the wireless communications network and the public

switched telephone network, so that calls originating at a central office may be completed to

wireless devices on the wireless communications network, and other calls originating at the

wireless devices on the wireless communication may be completed at the central office.
